```
const express =require("express");
const bodyParser = require('body-parser');
const app = express();
app.use(bodyParser.urlencoded({ extended: true }));
```

OR

```
const express =require("express");
const app = express();
const bp=require("body-parser");
const url=bp.urlencoded({extended:true});
app.post("/process_post",url,(req,res)=>
{
   res.send("test");
}
```

In Express version 4.16+, own body-parser implementation is now included in the default Express package so there is no need for you to download another dependency like body-parser.

You have the following code in your environment:

- **app.use(bodyParser.urlencoded({extended: true}));**

You can replace that with:

- **app.use(express.urlencoded());**

```
const express =require("express");
const app = express();
app.use(express.urlencoded({extended:true}))
```
